Amr Khalil August 20, 2026 at 1:41 PM

Dear Team,

GOSI has requested an Auto-Complete feature for both Chat and Email.

Please confirm whether this feature is currently planned and, if so, the expected release timeline.

If there is any available workaround or alternative approach that can provide similar functionality, please share it with us as well.

Best regards,
Amr Khalil

Proposed Response:
Hello Amr,

Thank you for contacting us.

At this time, Bright Pattern Agent Desktop does not provide an internal auto-complete/auto-correct feature for text that agents type in chat or email replies. Text input fields in both channels rely on the standard typing and spell-check capabilities of the agent's web browser (for example, Google Chrome or Microsoft Edge). Agents can

enable their browser's built-in spell-check and add the required languages to receive highlighted suggestions, but automatic completion or replacement of words is not available within the platform itself.

If your organization requires a platform-level auto-complete function, we can register a Product Enhancement Request (PER) with our Product Management team on your behalf. When a PER is accepted, its planned release timeframe will be communicated in our regular release notes.

Please let us know if you would like us to open a PER and feel free to share any additional details about the business impact or specific requirements so we can include them in the request.

Best regards,

[Your Name]

---

Amr Khalil August 20, 2026 at 1:42 PM

Note: what we mean is to have text auto complete

Andrey Stoychanov August 20, 2026 at 2:01 PM

Hello Amr,

I've converted this ticket to a PER, and forwarded it to our Product team for a review.
I hope we can implement this feature for you.
Though I don't have any specifics on a possible timeline as of now.

Thank You,

Andrey Stoychanov

Dear Team,

the customer request a date for this feature to be available in the system

also we want to know if BP can test our customized chrome ext and tell us if it have any issue

Best Regards,

Amr Khalil August 21, 2026 at 12:16 AM

wrong ticket sorry please discard my last reply

Support August 21, 2026 at 2:00 AM

Thank you for submitting your Product Enhancement Request. We genuinely value your input and appreciate you sharing your specific use case with us.

Your feedback has been recorded for consideration in our future feature implementation planning.

To help us better prioritize your request, we would appreciate if you could:

1. Indicate the priority of this enhancement relative to other requests from your organization
2. Provide a business case explaining why this feature would be valuable (both for your operations and why Bright Pattern should commit resources to its implementation)
3. List your use case in the Feature ideas section of the Community to have fellow customers vote for it

This additional information will significantly increase the chances of your specific use case being addressed in a future release.

Thank You,

Support

Andrey Stoychanov September 1, 2026 at 7:41 PM Internal note

Hello Sasha,

The customer cannot use third-party tools for this functionality due to strict security and compliance policies. This is why 2P is requesting native support for Auto Complete feature directly in the product.

Product Management September 9, 2026 at 1:36 AM

Good day.

We would like to clarify the exact meaning of "auto-complete" here. Can you please answer the following questions:

1. Is this about suggestion of a single word (similar to smartphone keyboards) or is this rather about a comprehensive inline, real-time text prediction as the agent types, where AI is trying to predict a whole sentence or paragraph — similar to Gmail's Smart Compose? Or is this something entirely different?
2. If it is something different, could you provide a short video of the autocompletion function you have in mind or a least a reference to a specific tool/product that has this feature built-in?
3. In case this is a comprehensive Gmail-like text prediction, is it expected to be generic, or should it take into account any customer-specific data sources (e.g., knowledge base, transcripts of previous interactions, etc.)
4. Should it be controlled by an individual user or enforceable by an admin?
5. What is the main purpose of this feature - faster agent training, faster handling times, consistent messaging, or something else?

Thank you.

Sasha Volgin

Thank You,

Product Management

Amr Khalil September 10, 2026 at 7:41 AM

Hi Sasha,

Please find our clarification below regarding the Auto-Complete requirement for GOSI:

1. The requirement is closer to Gmail Smart Compose rather than a smartphone keyboard suggesting only the next word.

2. Gmail Smart Compose is a good reference for the expected user experience. We are not looking for a separate popup or chatbot window. The suggestion should appear naturally inside the same Chat or Email text editor where the agent is typing.

3. The basic requirement can be generic text prediction, but ideally it should also be able to use customer-specific context when available.

For example, it would be valuable if the prediction could consider:

- The current customer conversation
- GOSI Knowledge Base content

- Approved responses or canned responses

4. We prefer the feature to be configurable and enforceable by the administrator.

The administrator should be able to enable or disable Auto-Complete globally or for specific users or teams. The agent should then be able to accept or ignore individual suggestions while typing.

5. The main objectives are:

- Reduce agent typing time and Average Handling Time
- Improve consistency of written responses
- Reduce spelling and wording mistakes
- Help agents compose responses faster, especially for repetitive customer inquiries
- Support new agents by making it easier to formulate appropriate responses

The highest priorities for GOSI are faster handling time and more consistent customer communication.

The Auto-Complete feature should complement, rather than replace, canned responses, Knowledge Base, and Agent Assist functionality.

Thank you,
Amr
