Proposed Response:

Hello Amr,

Thank you for reaching out.

Bright Pattern Agent Desktop does not currently provide a built-in auto-correct or auto-complete function for text that agents type in chat or email replies. The input fields in both channels use the native spell-check capabilities of the agent's web browser (e.g., Google Chrome or Microsoft Edge). Agents can enable their browser's spell-checker and add the required languages to receive highlighted spelling suggestions, but the platform itself will not automatically replace or complete words.

If your organization requires a platform-level auto-correct feature, we can submit a Product Enhancement Request (PER) to our Product Management team on your behalf. Please let us know if you would like us to proceed and feel free to share any additional details about business impact or specific requirements so we can include them in the request.

Best regards,

Sasha.
Use Case: The customer is aware of browser extension workarounds; however, internal InfoSec/Cybersecurity policies strictly prohibit installing any third-party extensions.

Product Management September 9, 2026 at 2:08 AM

Good day.

A few questions about this feature:

1. Do you mean highlighting of misspelled words to let the agent decide if they need to be corrected or automatic replacement of misspelled words?
2. Is this just about spelling or also grammar?
3. Should it be controlled by an individual user or enforceable by an admin?
4. Do your agents currently use this feature in any other applications, and if so, could you please provide a short video?

Thank you.
Sasha Volgin

Thank You,

Product Management

Hi Sasha,

Please find our clarification below regarding GOSI's Auto Correct requirement:

1. We prefer automatic correction of clear spelling mistakes while the agent is typing. If possible, highlighting or suggesting the correction before replacement would also be useful, especially when the system is not fully confident.

2. The requirement should cover both spelling and grammar. The main priority is spelling correction, but grammar correction would provide additional value for both Arabic and English conversations.
3. We prefer this feature to be enforceable and configurable by the administrator to ensure a consistent standard across all agents. The administrator should be able to enable or disable the feature globally, while agents can use the correction suggestions during chat and email handling.
4. Agents currently use similar spelling and grammar correction features available in common applications such as Konnect Insights but in Konnect its like a button .

Thank you,
Amr
